FIRST Methodology

Farmers' Independent Research of Seed Technologies (FIRST) is an independent corn and soybean yield testing service. We compare the performance of seed products in the fields of our farmer membership across 16 states: Delaware, Illinois, Indiana, Iowa, Kansas, Maryland, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, Pennsylvania, South Dakota, Virginia and Wisconsin. In 2016, we compared yields of 926 corn and 715 soybean varieties in 487 tests across 290 farms.

Seed tests are located to represent soil types and cropping practices common to a region comprising about 8-12 counties, but care is taken to select 2-6 acre sites that offer uniform, well-drained areas of the field. Sponsoring seed companies submit products best suited to each region from commercial lots and pay a sponsorship fee per entry. Entries are tested 3 or 4 times on each of 6 farms in FIRST corn regions or on each of 4 farms in our soybean regions.

Corn and soybean products within a 10-day and 0.7-group minimum maturity range, respectively, are pooled into a single all-season test or split into early- and full-season tests depending upon entry volume. FIRST managers package, randomize and plant the plots in strips 45' long and 10' wide (four 30" corn rows and soybean rows of either seven 15" rows or four 30" rows) using slightly modified commercial planting equipment. Typically, the center two corn rows and all soybean rows are used to measure yield.

JOE BRUCE, PH.D.

*General Manager/Data Manager,
FIRST*

Special Note: The FIRST organization gratefully acknowledges the 2016 financial support provided by the United Soybean Board. Their assistance in sponsoring our soybean seed tests, funding the grain quality analysis and distribution of information products, such as this publication, are valuable contributions to our success.

The Corn and Soybean Yield Guide is published annually by EFG, LLC, and is distributed throughout the Midwest. © 2016/7, all rights reserved by EFG, LLC, P.O. Introduction to FIRST Yield Advantage Tables

The Yield Advantage Tables in this publication are organized by crop maturity and contain corn or soybean products tested in 2 or more of our regions, either West or East of the Mississippi River, in the current and previous testing year. It reports the average number of bushels above or below the yield average of all products within a test. This approach allows us to identify which products are more competitive on a large number of farms and therefore are more broadly adapted. Hybrids and varieties with the greatest yield advantage can serve as benchmarks when considering the more local and detailed information available in our Regional Performance Summaries. These are posted to www.firstseedtests.com immediately after all sites in a region have been harvested and are available to visitors at no cost.

For each table, results for all seed products tested within the specified Relative Maturity (RM) range were included for summary. This allows a maximum number of products to qualify for presentation in tables. Yield Advantage for any one product includes all the data available. Regions in proximity of one another share much of the same

maturity range and so contribute most of the data to a table. These regions are shown with the table on the following pages. When reviewing FIRST regional performance summaries, please remember that product data may have included results from tests conducted in regions north of the depicted regions as a full-season product or in more southern regions as an early-season product.

FIRST data can more accurately predict performance in the field next year when seed products are shown to be both broadly and narrowly adapted to fields like you farm. Despite performing well in our tests, a product may not be well suited to your grain operation. Utilizing insight from knowledgeable seed company representatives, who possess much more area experience with their lineup, can ensure that their products are placed appropriately to deliver the optimum results you desire. Thank you for utilizing FIRST testing results in your seed buying process. When you find these results of value, be sure to tell your seed company representative. Doing so will encourage them to continue participation in FIRST testing.

"FIRST tests give me an objective, unbiased look at seed brands, genetics and technologies. With replicated plot work on my farm and by repeating the test at locations nearby I can make sound seed purchases."

Brian Herbst, Kasson, MN
FIRST Member since 2000

"Yield and standability are the big factors here. More data is better information so we look at numbers from our plot and from many seed companies around us. We give up discounts and have to write more check but it's worth it."

Mark Bentley, Oakland, IA
FIRST Member since 2010

FIRST Area Manager:
Randy Meinsma, F.I.R.S.T. CCB, Inc.

Unbiased, Accurate Testing. Every Time.

first

A Proven System Administered by Independent Businessmen and Farmers in Your Region

FIRST strives to deliver accurate yield results by planting seed products in mini-strips. Mini-strips are 45' long and 10' wide (four 30" corn rows and soybean rows of either seven 15" rows or four 30" rows) and replicated at least 3 times per test. These seed products are grouped into 3 blocks, each block is planted 3 times, for a total of 9 blocks. These product blocks are distributed from front to back and side to side much like a tic-tac-toe board. The green/yellow/red heat map shown on this page illustrates how mini-strips are arranged in blocks while showing yield differences through color. Each mini-strip contains a number indicating the seed product it contains. You will see 3 mini-strips containing the number 1. Notice that all tic-tac-toe blocks that contain seed product 1, also contain products 2 through 21. This is a block grouping of seed products.

We group products into blocks and distribute them across the tic-tac-toe board to keep products in similar soils to maximize consistency, thus mini-

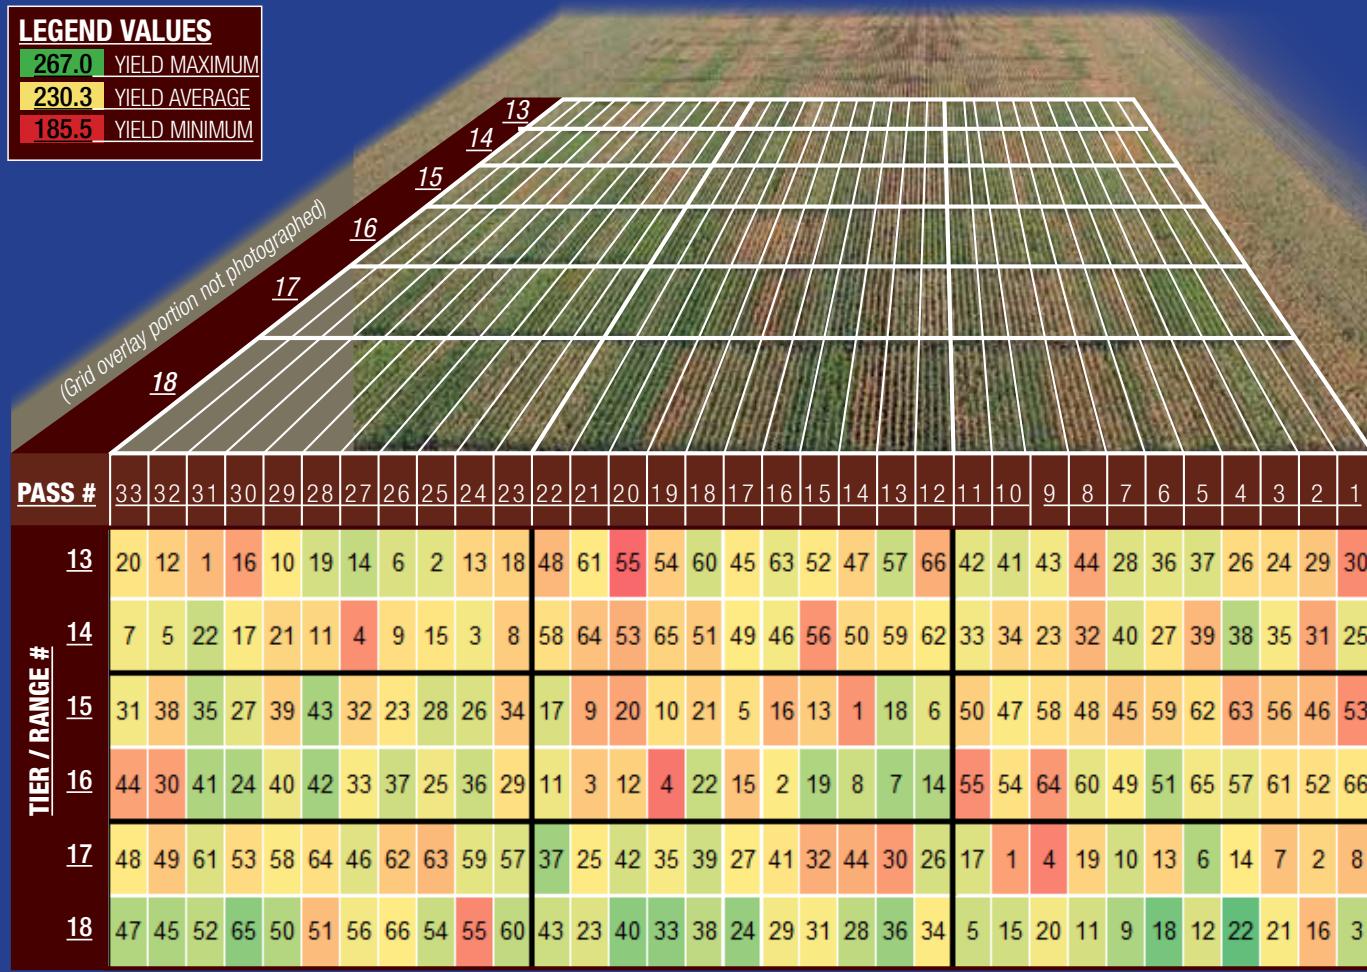

mizing experimental error, among products within the group. These factors provide more precise yield measurement and flexibility should a disruptive event (i.e. standing water) require elimination of non-uniform test areas.

The heat map representation of yields helps us identify yield inconsistency. In an ideal uniform test, the 3 mini-strips (replications) of seed product number 1 would always have a similar color on the map indicating similar yield everywhere. In a poor highly variable test, the 3 mini-strips would have great color difference, red and green colors. When this occurs, yield difference is typically due to non-genetic factors such as excessively wet soil (ponding) or dry soil (sandy area or hill top) in a small area of the test. If isolated to 2 or 3 blocks, we can frequently eliminate "bad or outlier" blocks to improve data quality so yield differences reported are due to genetics and not due to water ponding or other non-genetic factors.

Test Site Heat Map with Aerial Overview for Comparison

The aerial image shows a portion of the three 2015 FIRST corn tests located in Paullina, Iowa hosted by farmer member Mark Hibbing. The IANW region region full-season test (closest) and a portion of the early-season test (farthest) are shown. The "heat-map" superimposed over the full-season

test uses color to represent yield level for each mini-strip. Highest yield is bright green while lowest yield levels are bright red. Mini-strips containing the same number have identical seed products (3 mini-strips per product).

"I pick genetics first and technology second because I do a lot of corn-on-corn and no-till. Plant health and strong stalks and roots adds up to consistent yields year to year so I try to walk the plots before harvest."

"The only unbiased and reliable data I have found are the FIRST seed test results. There are still big differences between the seed products I grow and those I could have grown without the information I need every year."

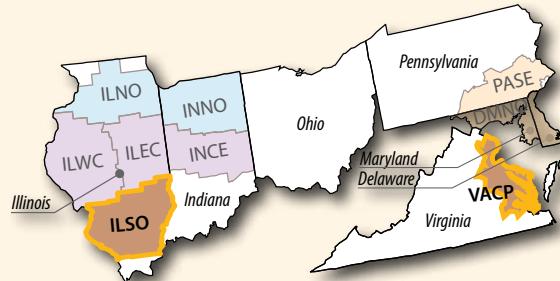

John Carmack, Tuscola, IL
FIRST Member since 1997

FIRST Area Manager:
Eric Beyers, 3rd Party Comparisons, LLC

Unbiased, Accurate Testing. Every Time.
